About me

I'm a front-end developer who enjoys developing websites and applications.

I work primarily with React, React Native, and Filament, while also developing back-end and front-end integrations on the HubSpot platform. I enjoy learning new things and turning personal ideas and projects into reality using clean, well-structured code.

Skills

Front-end	• React • React Native • JavaScript • TypeScript • HTML • CSS • Tailwind • Filament • Vue
Back-End & Tools	• Laravel • Filament • SQL • REST APIs • Git • GitHub
Integrations	• HubSpot • HubSpot UI Extensions • API Integrations

Professional Projects

HubSpot UI Extensions

Developed and maintained custom HubSpot UI Extensions for multiple clients, focusing on integrating external services and improving internal workflows.

Enterprise Client	Worked as part of a team that developed one of the first HubSpot UI Extensions worldwide using Laravel and PHP for the backend and React for the frontend. My main contribution focused on designing, developing and customizing the React components that made up the extension's user interface, integrating them into the HubSpot ecosystem. Technologies: HubSpot UI Extensions · React · Laravel · PHP
Food & Beverage Client	Developed a custom HubSpot UI Extension integrating an iframe-based configurator, specifically designed for the client's internal management of holiday gift basket orders. The solution included a fully custom-built configurator website developed specifically for the client, as well as automated PDF generation and download for order receipts. Rather than relying on individually developed components, the interface was dynamically generated using SheafUI based on the client's requirements and the data received, including the generation of PDF documents. Technologies: HubSpot UI Extensions · React · laravel · PHP · SheafUI · PDF Generation

HubSpot Integrations

Developed and maintained HubSpot Custom Workflow Actions to help and develop the company automation.

Enterprise Client	Custom integrations between HubSpot and the client's ERP were developed using Custom Workflow Actions (CWA) to automate internal processes and optimize data management. The solutions were designed to eliminate manual tasks and improve data synchronization between the CRM and core business systems. Technologies: HubSpot · Custom Workflow Actions · API Integrations · Automation · Laravel · PHP
Automotive Client	Developed a custom integration for managing motorcycle chassis data and warranty creation within HubSpot. The solution checks the existence of a chassis number and automatically creates warranties based on the vehicle chassis and associated customer. I also developed a custom portal for importing CSV files, allowing the client to efficiently populate and update the chassis database through a dedicated interface. Technologies: HubSpot · API Integration · Filament

Internal Projects

ERP	A complex internal ERP developed as a team using Filament, designed to centralize and streamline the company's project and business management. The platform provides comprehensive management of projects, tasks, individual work items and teams, as well as internal client and revenue management. It is also integrated with the Solidtime API to synchronize and manage project time tracking. My main contribution focused on the frontend and visual aspects of the platform, as well as the development and customization of the Filament-based interface and its components. Technologies: Laravel · Filament · PHP · Solidtime API · REST APIs
------------	--

Personal Projects

Trophy Lab	A Progressive Web App that connects to a user's Steam library through their Steam ID, providing an interactive way to track game achievements and completion progress. Users can select a game to view its achievements and current completion status, with multiple sorting options to easily organize and navigate the available data. Selecting an achievement opens a dedicated YouTube guide, with mobile devices automatically opening the YouTube app for a seamless experience. The project combines external API integration, dynamic data management and responsive design to create a convenient tool for tracking and completing Steam achievements across desktop and mobile devices. Technologies: React · TypeScript · PWA · Steam API · YouTube Link: https://steamtrophiesapp.onrender.com
KnuckleBones	A Progressive Web App inspired by the dice game of the same name from <i>Cult of the Lamb</i>. The game is a fast-paced local multiplayer experience where players place dice on their board, build combinations and score points while trying to outplay their opponent. The project includes a dedicated rules page and uses assets sourced from the game's wiki to recreate its visual identity. The interface was designed primarily for mobile devices, while remaining fully playable and responsive on desktop. The project focuses on recreating the original game's mechanics and experience through an accessible web-based implementation. Technologies: React · TypeScript · PWA · Responsive Design Link: https://knucklebones-rasx.onrender.com

Personal Work in Progress

ScanDex	A React Native mobile application for scanning and managing collectible cards, currently focused on Pokémon cards. The app allows users to scan a card, identify it through a dedicated API and store its relevant information in a database, creating the foundation for a personal digital collection. The goal is to make cataloguing and managing a physical card collection faster and more convenient. The project was created as a personal tool for my father, a passionate Pokémon card collector, with the intention of turning a real-world need into a practical mobile application. Technologies: React Native · TypeScript · REST APIs · SQL database
WoodBits	A React Native mobile collection designed to bring traditional wooden games into a digital environment. Rather than focusing on a single game, WoodBits aims to gather and recreate a variety of classic wooden games, such as Mancala, Shut the Box and other traditional tabletop games, within a single application. The project explores how physical game mechanics can be translated into intuitive mobile interactions while keeping each game's original identity and simplicity. Technologies: React Native · TypeScript
Home Server	A self-hosted home server built on a Banana Pi, using Linux as the foundation for hosting and managing my personal projects. The goal is to create an independent infrastructure where my applications can be deployed and accessed online without relying on third-party hosting platforms or managed services. The project explores server administration, application deployment, networking and self-hosting, with the Banana Pi acting as a lightweight personal server for multiple projects. Technologies: Linux · Banana Pi · Self-Hosting · Networking · Server Administration

Experience

Front-End Developer

[Orbital Waves] · [2024 – Present]

Working as a Front-End Developer on custom web applications, integrations and internal business tools for both clients and internal teams.

My work mainly focuses on building and customizing user interfaces, developing React-based components and integrating external services and APIs.

I also work extensively with HubSpot UI Extensions and Laravel/Filament-based applications.

I collaborate with the development team to design and implement tailored solutions based on specific business requirements, with a focus on usability, automation and maintainable code.

Core Technologies: React · React Native · Laravel · PHP · Filament · HubSpot · HubSpot UI Extensions · REST APIs
